

Conservation cost sharing program

by Betty Bauer
Payette R.E.D. Clerk

Iowa's Department of Soil Conservation cost share program for permanent soil and water conservation practices has been in effect for 30 months as of the end of 1975.

Conservation practices approved by the Payette Soil Conservation District Commissioners are critical area planting, diversions, grade stabilization structures, drained waterways, terraces, tree planting, and pasture-land planting.

The disbursement of 1975-76 fiscal year funds of \$2,000 has included 13 grade stabilization structures, three waterway projects, 47,425 feet of terracing involving 16 farms and 400 feet of diversion terrace. Several of the projects had been carried over and were completed in 1975.

Terraces and grade stabilization structures were chosen as high priority practices for 1975 by the Payette SCD Commissioners. To date, five grade stabilization structures and 18,300 feet of terracing involving 10 requests have been installed. In addition, 12,225 feet of terracing has been completed in 2 long term agreements during the past two years. Five other practices have been approved and are pending completion. Several high priority projects received up to 75 per cent reimbursement of actual cost using combined state and federal funds.

Two long term agreements were also initiated in 1975 using 1975-76 fiscal year funds with 9,300 feet of terracing being installed the first year of the agreements. Other projects completed during the year were 4,300 feet of terracing involving three farms and a grade stabilization structure. State funds will be available again this year with cost sharing up to 75 per cent of actual cost. State cost sharing applications are now being taken at the District office, 126 S. Vine Street, West Union.

ZIP SEEDER—Dave Kadel, RCAD Coordinator from Proctor, poses by his "zip seeder" used for direct pasture seeding. The machine was used in a pasture improvement demonstration last year and will be available to a few farmers again this year.

WINDBREAK—A farmstead windbreak was planted on the Mrs. Conrad Hauer farm in Eden township. Kerry Klee, son of Eugene Klee is shown standing between a row of honeysuckle shrubs and two rows of arbutus. The trees may grow to 10 feet a year with good care.

HOME ECONOMIST—Patty Dillon is the Fayette County Extension Service's home economist.

CLERK—JaAnn Rex is the ASNC clerk at Fayette.

PART-TIME CLERK—Charlene Norman is a part-time office clerk with the county FFA office in West Union.

Marie Kleppe
Assistant Cashier

On this, our 42nd year, we are again pleased to note a substantial growth in deposits for that is our best measure of your confidence in us. From 1965 to 1976 deposits have shown a three-fold gain; during the last year better than a 3.5 million dollar gain. These are heart-warming figures.

At the same time we are pleased to report a steady growth in loans, for that is our best measure of your confidence in us. Just as deposits have grown three-fold in the 10-year span, loans have increased at that same rate and our 16.5 million in loans represents a 23 per cent increase from last year's total.

We at the First firmly believe that money deposited with us should be plowed back into the community in the form of quality loans to help the community grow. And we believe these figures show we're doing just that.

an invitation

First National Bank

FDIC

First of West Union

To those of you who are not now customers of the First of West Union, we issue a cordial invitation to join our ever-growing family. Come in, talk to us about opening a checking or a savings account, let us help you with plans for your future through First of West Union loan.

Protecting Our Environment HOW PLASTICS HELP

Even though plastic materials, mainly packaging, make up less than two percent of solid waste, the increasing popularity of plastic waste good environmental news, for even so waste, plastics have some very desirable properties.

The current most common method of disposal is dumping on landfills. Fortunately in this regard, the decomposition of plastic is very slow, gas generation is

mineral and ground water are not polluted. In the future, the news may be even better, for it is possible to dispose of plastic through modern incineration, and then just the energy generated by the fire to go to use. Many such innovations are being considered in planned right now.

TERRACES—Round hay terraces with farmstead backsheds were constructed on the Carl and Laker Becker farm in Putnam township. Water held by the terraces is drained through surface in-take into the lines.

COMPLETED—Completed terraces on the Becker farm are straight east-west. Average slope of the field is only 3-4 per cent but slopes were exceptionally long. The terraces will reduce slope length and thereby prevent topsoil, fertilizer, and chemicals from leaving the field.

EROSION CONTROL—An erosion control dam was built to control a gully and protect a driveway on the Richard Jensen farm in Pleasant Valley township. The dam is shown during construction.

WATER POOL—The permanent water pool on the Jensen dam is beginning to fill soon after completion. Terraces on fields in the watershed will protect the structure from excessive sedimentation.

GUARD THE FUTURE OF YOUR FARM, COMMUNITY

Good soil conservation techniques work like a watchdog in the fields guarding against erosion—the national farm enemy!

COMMISSIONERS AND STAFF — Fayette County Soil Conservation District commissioners and staff of the office at West Union are, from left to right, seated, Frank Thre, district commissioner; Randall Brue, district clerk; Hanky Lester Anderson, district commissioner chairman; and William O. Baker, district commissioner.

James Stewart, Oelwein, district commissioner; Paul Schumann Jr., Arlington, district commissioner; Dave Bennett, Elgin, district commissioner; and William "Bill" Brue, West Union, conservation technician.

Soil conservation big job in Iowa

DES MOINES — Numerous acres of cropland protected terraces, ponds, and protective against soil erosion with crop grass waterways have been built in Iowa along with millions of dollars of Iowa's soil is less than half done.

"More than 100,000 landowners are cooperating with local soil conservation districts to protect soil on their farms," says William Brue, state conservation officer for the U.S. Soil Conservation Service (SCS). "They've made substantial progress, but the job of soil conservation is not the back of the work is ahead."

"One fact that makes progress look slow in Iowa is the increase in row crop acreage. Land that was adequately protected with rotations 20 or 30 years ago is subject to severe erosion when it's continually cropped," Brue said.

SCS figures show that since 1960 more than four and one-half million acres of land have been treated for erosion. But in that same time row cropping increased by over five million acres.

"There will be continued demand for crop production and that will put more stress on the land," adds Brue. "One of the biggest challenges will be to protect cropland."

Brue sees conservation

techniques, the practice of leaving last year's crop residues on the soil surface, as a major soil conservation technique.

More land could be protected by using conservation tillage and terraces together, says Brue.

get an application job you can depend on — now and later

FARMER HOME ADMINISTRATION — FmHA officials are, from left to right, Claude Hayes of Arlington, county commissioner; Jim Rogers of West Union, FmHA county supervisor; and Benno Steffen, county commissioner.

Greens conserve energy

Americans have often been described as people who regard nature as a "nuisance" who, sweeping from the depths of a bottomless reservoir, unforgivingly and ruthlessly upon her inevitable children.

Today we, the children, are "orphaned" — someone has suggested, because there no longer exists a boundless reservoir "who beckons to our every need. We are, so to speak, on our own and we must make do with the resources at hand if we are to survive.

If the image is apt, it is especially so in regard to our use of fossil fuels — coal, oil, gas, whose limited and irreplaceable supplies we are consuming at an ever increasing rate.

Fortunately, however, there are other resources in nature available to us which can be our allies in conserving the irreplaceable energy supplies. The most useful of these resources are vines.

One vine which is available in unlimited quantities, provided we are prudent and patient stewards of it, is the grapevine.

That resource, of course, is plant life, especially trees, shrubs and vines. According to the American Association of Nurserymen, these abundant gifts of nature are among the most effective energy conservers of our disposal.

Take leaf conservation, for example. Tests conducted in South Dakota demonstrated that a house bordered on the north, east and west sides by trees which functioned as windbreaks consumed 40 per cent less fuel than a fully exposed house — a truly remarkable savings.

A related discovery is that a hedge or tree windbreak is far more effective than a solid wall of masonry or wood. This surprising fact was proven in tests which showed that the solid wall lifts the wind up over itself and causes turbulence on the lee side, whereas the shrubs let enough wind pass through to dissipate the force of the down draft.

Conserving air conditioning energy is another important function plant life can perform. One need only walk into a forest on a hot day to realize that trees are nature's air conditioners.

Properly shaded houses have less need for costly air conditioning. Even where air conditioners have been installed, they are not used as often.

FmHA loans help with conservation practices in area

By James Rogers

The Fayette County Farmers Home Administration office called interest credit can be applied when family adjusted income does not exceed \$8,000 per year in the county. Long-term loans are made for conservation practices including terracing, field clearing and erosion control.

Other land assistance for farmers includes farm ownership loans for land purchase, construction of buildings or other structures, and the development and refinancing of farms. These are for five per cent interest and repayable over 10 years.

During 1975 construction was completed on three rental projects in the county. The first, the Elgin Housing Corp., buildings were both completed and occupied in the spring of 1975, while the Hawk Eye Housing Corporation building was completed and rentals began in October.

The development and refinancing of farms is for five per cent interest and repayable over 10 years. The Elgin Housing Corporation has established 23 apartments in the county and 23 rental projects in Fayette County that were previously owned by private individuals.

The Elgin Housing Corporation has established 23 apartments in the county and 23 rental projects in Fayette County that were previously owned by private individuals.

FmHA supplements credit extended by private lenders, as loans are only made when private credit is not available.

Saturday, February 23, 1978 credit is not available. Periodic reviews are made of a borrower's progress and graduation to banks and other lenders are achieved when ready.

Each person applying for credit is given equal consideration without regard to race, creed, color, marital status or national origin.

The West Union FmHA is staffed by James D. Rogers, County Supervisor; William O. Baker, Assistant County Supervisor; Dorine M. Albion, County Office Assistant; and Charles Norem, County Office Clerk. A County Committee made up of Louis Kane, Westgate, Claude Hayes, Arlington, and Benno Steffen, Clermont, reviews and certifies agricultural loans for eligibility.

Renovate pastures in Allamakee, Clayton counties

4-H ASSISTANT — Myra Handorf of Lamoine is a 4-H assistant with the Fayette County Extension office in Fayette.

Sediment is serious pollution problem

DES MOINES — Iowa's most significant water pollution problem is sediment from erosion soil erosion, according to Larry Crain, director of the Iowa Department of Environmental Quality.

This sediment, which stream channels, affects aquatic life, increases stream water turbidity, and reduces the capacity of lakes and reservoirs.

Sediment also has other direct impacts on Iowa waters. Soil erosion carries nutrients, agricultural chemical residues, animal waste residues, and other pollutants into state waters.

These pollutants can increase the aging rate of lakes and reservoirs and affect the suitability and safety of recreational waters and water supplies.

State and federal water pollution control programs have concentrated in point source pollution from point source water discharges. In Iowa, this is aimed at controlling water pollution from municipalities, industries, and large livestock feeding operations.

However, according to Crain,

by David W. Kudek
ICAD Project Coordinator

In the spring of 1975, Upper Explorerland Resource Conservation and Development Project assisted in renovating nine pastures in Allamakee and Clayton Counties demonstrating no-tillage methods. The renovations were conducted in cooperation with the Extension Service, the U.S. Soil Conservation Service, the Chevon Chemical Company, and local farmers.

In the five-county ICAD area, there is almost one-half million acres of permanent pasture, most needing renovation to provide its full potential for pasture production. Much unimproved pasture hardly

produces enough to pay its taxes. If properly renovated and managed, it has potential for producing two to three times the amount of forage which is presently being produced.

The no-tillage method used last year consisted of interseeded legumes in existing grass pastures without any type of tillage. Last year a Zip Seeder was used in interseeding. This was the type of machine that was currently available. Other brands of machines are now available.

Interseeding allows for the introduction of legumes into existing grass pastures with a minimum erosion hazard as well as allowing pasture to be used during most of the seeding year.

These benefits make this type of renovation conducive to steep or rocky areas.

The key to this type of renovation is good management of the part of the farmer as well as chemical control of weeds and existing pasture. Chemical control of existing pasture is necessary at establishment time to give the new seeding a chance to get well enough to compete with existing pasture before it begins to grow.

4. Fertilize according to soil test.

5. Seed with a type of interseed.

6. Apply chemical to control existing sod. (According to label instructions.)

7. Properly manage the new seeding after establishment.

It is important to follow all steps in the establishment process. Chemical control of existing pasture before it begins to grow.

The steps involved in this type of renovation include the following:

1. Take a soil sample.

2. Grass closely or clip the existing pasture.

3. Control weeds.

absolute requirement for success.

Last year, we renovated pastures with Birdseed Tyfofol, Alfalfa, Reed Canarygrass, Crownvetch, Bromegrass, Or.

Due to the great success of last year's demonstration, many farmers have expressed interest in trying it on their farms this year. Due to its popularity, two persons in Clayton County have purchased interseeders to rent to

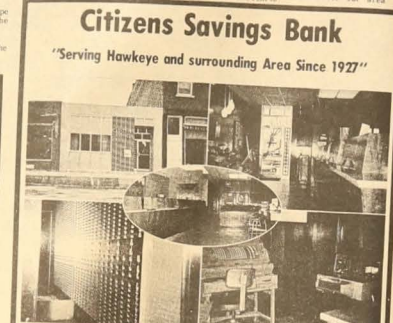

farmers for pasture renovation. Other individuals and groups have expressed similar interests.

This spring, RCAD and cooperating agencies plan to assist farmers in renovating two pastures in each of the five ICAD counties to serve as demonstration of what can be done to improve pastures without tillage.

We think this method has great potential for our area.

PASTURE — Pasture improvement was a key to the Extension service demonstration project in 1975. Using the "zip seeder" a pasture seeding was accomplished in a one-acre operation. A tour at plantings included the Sylvester Wille farm shown here in Clayton County.

COMMITTEE — Members of the Fayette County ASCS county committee are, left to right, Leo Lynch, Waucoma; Herbert Ash, Elgin; and Randolph Peterson, Elgin.

Forestry incentive program

AMES — A program to increase timber production and prevent soil erosion is available in Iowa, landowners in 47 counties.

The Forestry Incentives Program (FIP) shares costs of tree planting and timber stand improvement with private landowners, according to U.S.

technical forestry field assistance.

These eligible include private individuals, associations, and corporations who own individual private forest lands of less than 500 acres.

Two plans are included in the program — tree planting and forest improvement. Tree planting is designed to establish a stand of forest trees for timber production and to preserve and improve the environment. Cost sharing under this practice is authorized for tree planting, land preparation and fencing.

The second plan is for improving a stand of forest trees by releasing desirable seedlings and young trees. This improvement should be carried out in a manner to preserve or improve wildlife habitat.

For cost share payments, land must be suitable for reforestation if presently not in forest. Reforestation of non-forested and understocked forest lands or land for intensive management and protection of forest resources for timber production are also eligible, according to Farris.

A participating landowner must have a forest management plan prepared by a forester for the timber program area in which the practices will be carried out.

STRETCH YOUR ACRES

With productive soil at a premium, our community Farmers and Ranchers deserve a big congratulations for a job well done in maintaining a well organized soil program for the good of us all. For working side by side with a soil conservation agent to truly keep our soil rich with plenty.
