

1964 Soil Conservation Award Winners

The week of June 14-21, set as Soil Conservation Week, calls special attention to award winners in the annual Soil Conservation Achievement Awards in Hardin county. The winners for 1964 are shown in photos above on their respective farms. In the top photo is

Harry Lawless, who farms 150 acres northwest of Eldora, as he stands in a field of oats. In the background are contoured corn and hay fields. Lawless also operates a 90 acres farm in Tipton township owned by Glenn Paul. In the lower photo is Gerald Modlin, who farms

260 acres in Eldora township southeast of Eldora, as he cultivates corn on one of the terraced fields. The two were selected as winners in March of this year in recognition of outstanding accomplishments in soil and water conservation. H-I Photo, Engraving.

SOIL CONSERVATION WEEK BEING OBSERVED —

Recognize Lawless, Modlin Work In Soil Conservation

The week of June 14 to 21, set aside as Soil Conservation Week, calls special attention to winners of the annual Conservation Achievement Awards in Hardin county.

Selected as winners of the 1964 awards in recognition of outstanding accomplishments in soil and water conservation are Gerald Modlin and Harry Lawless, both of Eldora.

Modlin, who operates a 260 acre farm 5 miles southeast of Eldora, became a cooperator with the Hardin Soil Conservation District in 1959.

Gerald started in the spring of 1959 by building 3,300 feet of terraces with a tractor and plow. Additional parallel terraces have been constructed three times with a total of 15,000 feet now on the land.

Additional conservation measures installed on the Modlin farm include 120 acres of contouring and 4,000 feet of grassed waterways. A diversion terrace has been constructed and field boundaries established on the contour.

Modlin is ably assisted with his farming operation by his wife Sarah, sons Dennis and Dick and

daughter Joyce. Gerald has been active in community work. He is currently president of the Hardin County Farm Bureau. In addition, he has served as county vice-president three years and county secretary six years.

Lawless has been active in the Hardin SCD since 1953. The District now in its 19th year of operation, has cooperators numbering 832.

Lawless, who operates 160 acres in Jackson township 7 miles northwest of Eldora, has installed numerous conservation practices. Included are 40 acres of contour stripcropping, tile drainage, grassed waterways and tree planting. Lawless operates an additional 90 acre farm in Tipton township owned by Glenn Paul. Terraces, contouring, diversions, surface drainage and grassed waterways are some of the major practices on the Paul farm.

Photos of Lawless and Modlin on their respective farms can be found on the front of the second section of today's Index, as well as ads in the second section emphasizing the need for soil and water conservation.

Proclaim June 14 To 21 Soil Cons. Week In Iowa

Governor Harold E. Hughes signed a proclamation designating the week of June 14-21 as Soil & Water Conservation Week in Iowa.

In signing the proclamation, Governor Hughes noted that "the development of Iowa land and water resources through soil and water conservation, flood prevention, and wise land use, is essential to maintain agricultural income and protect the economy and tax base of the State."

He expressed the desire that the people of Iowa recognize the important work being conducted in each of the State's 100 Soil Conservation Districts. "It is of the utmost importance that we continue to advance our cooperative efforts in soil and water conservation work, particularly in small watersheds, where opportunities are offered to further this all important work," he said.

Hardin County One Of 100 Soil Cons. Districts In Iowa

The observance of Soil and Water Conservation in Hardin county from June 14-21 coincides with special recognition being given in the 100 Soil Conservation Districts in Iowa.

Iowa was completely organized into Soil Conservation Districts in 1952. Each District is a sub-division of the State government and is governed by farmer elected commissioners.

Commissioners in Hardin SCD are Dean Kelsey, Iowa Falls, Chairman; Paul Primus, Steamboat Rock and Dale Petty, Eldora. Ted Cutler, New Providence; Homer Calkins, Iowa Falls and Kermit Whitehead, New Providence serve as assistant commissioners.

The United States Department of Agriculture provides assistance to the District through the Soil Conservation Service. Cal Moore, Work Unit Conservationist and Dean Miller, Conservation Technician are assigned by the SCS to the local District. Elleen Miller is employed as District secretary and clerk. Mike Brogden is employed as State Aid.

Lake Site Favorable

Core samplings were taken Wednesday at the dam site of the lake to be built at the 135 acre recreation area being planned by the Iowa River Conservation and Improvement Club located northwest of the Steamboat Rock dam. Ten different core sampling were taken Wednesday, the deepest being 34 feet, and only one sand pocket, which is not favorable for dam building, was hit. The rest of the core samples brought up clay, which is favorable as a core material for building dams. Stanley Collins, area engineer of the Soil Con-

servation Commission from Mason City, said that the site would be feasible for a dam and that the Soil Conservation office would complete plans on the 14 acre lake, which will be 25 to 30 feet deep at its lowest point. Shown above are the drilling operations Wednesday. In the group are Gale and Rex Hackney, who were doing the drilling, Bob Finger, Hollis Havens and Juch Juchems, all members of the Club's board; Collins, area engineer; and Ben Van Hove, of the McDowell Excavating Company. 79,000 Iowa Farmers Apply In Conservation

More than 79,000 Iowa farmer are applying soil and water conservation practices on 14.5 million acres of Iowa land.

"In reviewing the conservation achievements of Iowa's soil conservation districts, we just can't help expressing pride and thankfulness in their accomplishments," says William H. Greiner, director of the State Soil Conservation Committee.

Greiner says about 56,000 of the 79,000 district cooperators have now developed complete soil and water conservation plans on over 10 million acres of agricultural land. During the past year, 3,807 district cooperators developed complete farm conservation

Farmers Develop Recreation Areas

Iowa farmers have done more in the development of recreation areas for enjoyment of farm and city people than any other group or organization in the state.

Much of the recreational use of these areas has been free to all. According to Frank H. Mendell, state conservationist of the Soil Conservation Service, most of the recreation development has resulted from farmer-district cooperators carrying out jointly developed soil and water conservation plans on their farms.

Mendell cites the following practices as significant contributions to recreation in the form of hunting, fishing, water sports and vacation farms: 25,000 farm ponds with 18,000 stocked with fish; 89,000,000 feet of field border plantings; 9,500,000 feet of row plantings; 65,000 acres of wildlife areas; 140,000 acres of grassed waterways.

County, state, and federal agencies, Mendell points out, have assisted farmers in these accomplishments by providing such incentives as technical services, cost-sharing and long-term conservation development loans. Iowa's 100 soil conservation districts are conscious of the needs for outdoor recreation and the benefit of both rural and urban people. They are considering the development of income-producing recreation as a means of assisting the family type farms and communities to develop additional sources of revenue.

Meeting recreation needs of rural and urban people. Using land in accordance with its capability.

Helping to achieve erosion control on non-crop land through use of grass and/or woodland cover.

Cooperating effectively in programs designed to control our plus farm commodities.

Presently, 61 soil conservation districts have revised their plans to incorporate new objectives to meet needs of rural and urban people.

On 706,000 acres. According to Greiner, 1963 tops any other year for the number of farmers cooperating with Iowa's soil conservation districts.

During 1963 the Soil Conservation Service technicians provided services to more than 41,000 individual land owners and operators, 2,700 organized groups of farmers and over 1,600 consulting type services to urban people.

During 1963 the Soil Conservation Service technicians provided services to more than 41,000 individual land owners and operators, 2,700 organized groups of farmers and over 1,600 consulting type services to urban people.

Tailor Your Conservation Plan To Fit

There's no one plan you must follow to conserve soil and water on your farm.

Rather, says Bill Oschwald, extension agronomist at Iowa State University, many types of plans can be used, each designed to effectively meet soil and water conservation problems. A good farm plan is a production program designed within the capabilities of the soil.

Oschwald says the rule-of-thumb is as simple as this: "The more serious your erosion problems, and the more intensively you use row crops, the more you will need to use mechanical soil conservation practices such as terraces, contouring or grassed waterways."

As an example, Oschwald says a Tama soil with moderate erosion, a 10 percent slope and a 200 foot slope length can be treated in any of the following ways:

(1) If terracing is used, erosion can be held within safe limits with a corn-corn-oats-meadow rotation. (2) Use strip-cropping — a less intensive conservation practice — and you must add a year of meadow to make a 5-year corn-corn-oats-meadow-meadow rotation to hold erosion to safe limits. (3) Using contouring alone, a rotation of one year corn, one year oats and three years meadow will do the job. (4) Use no mechanical practices, you can safely grow one year corn, one year oats and five years meadow — a 7-year rotation.

Oschwald says that any of the preceding combinations are equally effective in controlling erosion. The rotation-mechanical conservation practice combination you would choose depends on your goal—whether you want a high intensity of grain production or a high intensity of forage production.

Level terraces furnish a partial solution to the moisture shortage. For example, in 1956, a dry year, corn yields in Shelby County measured 105 bushels in the terrace channel and 41 bushels in the area between the terraces. Experimental plots at Castana have shown similar results in years with less than average rainfall during the growing season. However, in years in which rainfall is heavy, there may be a reduction in corn yield where too much water is concentrated in the channel area. Since dry years probably occur more frequently than wet years in this area, yields should be enhanced by use of level terraces.

Studies Drainage Practices Here

Cal Moore, Work Unit Conservationist, standing, and Dean Miller, Conservation Technician, left, both of the Hardin Soil Conservation District office, go over an aerial map

with Bahattin Sayan of Turkey. Sayan, Turkish drainage engineer, was in Eldora over the weekend viewing drainage practices. H-I Photo, Engraving.

Turkish Drainage Engineer Tours Hardin County Farms

Bahattin Sayan of Turkey was in Eldora over the weekend viewing soil conservation practices first hand.

Sayan, chief drainage engineer of the Soil Conservation Service in Ankara, Turkey, has been in the United States for the past 9½ months studying soil conservation.

From Friday afternoon until Sunday, the Turkish visitor was a guest of the local Soil Conservation Service office. Saturday, Cal Moore, Hardin Soil Conservation District Work Unit Conservationist, conducted Sayan on a tour of Hardin county farms.

Sayan's primary interest in Hardin county was to study first hand the drainage systems. Sayan also inspected tiling operations.

Prior to coming to Iowa, the Turkish Soil Conservation Engineer had studied soil conservation measures in Utah, California, Oklahoma and Texas. Upon leaving Iowa, he was to go to Mississippi and then to Virginia before departing for Turkey.

Sayan, who speaks English, is in the United States under the Agency for International Development in cooperation with the U. S. Department of Agriculture.

Two Selected For Iowa Teachers Conservation Camp

Mrs. Ray McDowell, Eldora, and Gary Hornung, Hubbard, have been selected as recipients of the Hardin Soil Conservation District scholarships to the Iowa Teachers Conservation Camp, according to Dean Kelsey, chairman of the the District.

Two scholarships are awarded annually to teachers actively engaged in teaching in the county. Mrs. McDowell and Hornung will be attending June 28 to July 18.

The Camp, now in its 15th year of operation, is a regular college course but differs in that a major portion of the instruction is done in the field. The field trips aid the teachers in learning conservation by observing natural resources and seeing the actual conservation practices put into use.

Soil CONSERVATION Notes

The Soil Conservation Service is nearly 30 years old. On April 27, 1935, Franklin D. Roosevelt signed Public Law 46, enacted by the 74th Congress without a dissenting vote. The Act declared soil and water conservation on farm, grazing, and forest lands of the nation to be a permanent policy of the Congress, and it established the Soil Conservation Service in the Department of Agriculture.

The Iowa soil conservation district program is a relatively young program in terms of years. The first district was organized in 1940 and the last in 1952, making a total of 100 districts for the state.

June 14-21 marked Iowa's 27th observance of soil and water conservation week. Prior to 1955, "water" was not included in the week's title. Iowa was one of the first states to set aside a time when special emphasis is given to conservation.

The most important features of watershed programs are the practices which hold the raindrops where they fall. These practices such as terracing, contour farming, grassed waterways and strip-cropping retard water runoff to protect the soil.
